Find $x$ giving reasons.
(d) A polynomial is given by $P(x)=x^{3}+a x^{2}+b x+6$. Find the values of $a$ and $b$ if $(x+3)$ is a factor and if 12 is the remaider when $P(x)$ is divided by $(x+1)$

Question 2 (12 marks)
(a) (i) Express $\sqrt{3} \cos \theta+\sin \theta$ in the form $A \sin (\theta+\alpha)$ where $A>0$.
(b) The line $\lambda_{1}$ has the equation $x-y+1=0$ and meets the $x$-axis at $A$. The line $\lambda_{2}$ has the equation $\sqrt{3} x+y-2=0$ and meets the $x$-axis at $B$. $\lambda_{1}$ and $\lambda_{2}$ meet at $C$.

(c) The diagram below shows Donna standing at $D$ on level ground, whilst Gemma is standing 2000 m away at G on the same level ground. They both take the bearing and elevation of a place $P$ at the same instant. Donna finds the bearing is $300^{\circ} \mathrm{T}$ and the angle of elevation $25^{\circ}$, whilst Gemma finds the bearing to be $240^{\circ} \mathrm{T}$ and the angle of elevation $17^{\circ}$.

(i) Copy the diagram onto your sheet, showing all the information given.
ii) Show that if the height $P A$ of the plane is $h$ metres then

(a) Todd and Meaghan go to the cinema with three other couples. They sit together as a group in a single row.
(i) In how many ways can they be arranged?
(ii) In how many ways can they sit so that each couple is together?
(iii) Todd and Meaghan had an argument going into the cinema and decided
they do not want to sit together. How many arrangements are possible if the other couples are still sitting with their partners?
(b) Two circles intersect at $V$ and $W$ as shown. A line through $V$ cuts the two circles at $X$ and $Z$. The tangents at $X$ and $Z$ meet at $Y$.
