### Section A: Multiple Choice (1 mark each)

Select the alternative A, B, C or D that best answers the question. Fill in the response oval completely.

Sample:	2 + 4 =	(A) 2	(B) 6	(C) 8	(D) 9
		$A \bigcirc$	В 🔴	СО	D ()

If you think you have made a mistake, put a cross through the incorrect answer and fill in the new answer.

If you change your mind and have crossed out what you consider to be the correct answer, then indicate the correct answer by writing the word **correct** and drawing an arrow as follows.

### Write your answer on the response grid on page 2

1. Which statement is correct concerning the use of a catalyst in the Haber Process?

- (A) A catalyst enables a lower reaction temperature to be used.
- (B) A catalyst produces ammonia of greater purity.
- (C) A catalyst speeds up the forward reaction and slows down the reverse reaction.
- (D) A catalyst removes ammonia from the product mixture allowing the equilibrium to shift to the right.
- 2. What is the name of the compound below?

- (A) 1-chloro-1,2-difluoropropane
- (B) 3-chloro-2,3 difluoropropane
- (C) 1,2-difluoro-1-chloropropane
- (D) 1-chloro-1,2-fluoropropane
- 3. If Professor Le Châtelier visited an ammonia factory which combination of variables would he advise to maximise production?
- (A) low pressure and low temperature
- (B) low pressure and high temperature
- (C) high pressure and low temperature
- (D) high pressure and high temperature

### 4. Sydney Water tests a sample of water at Warragamba Dam. The results are shown in the table...

Aluminium (µg L <sup>-1</sup> )	Total chlorine (mg L <sup>-1</sup> )	Fluoride (mg L <sup>-1</sup> )	$Iron \ (\mu g L^{-1})$	Manganese (µg L <sup>-1</sup> )
< 10	1.52	1.11	< 20	6

Which chemical species could be efficiently assayed using AAS?

- (A) Total chlorine
- (B) Total chlorine and fluoride
- (C) Aluminium, iron and manganese
- (D) Aluminium, total chlorine, fluoride, iron and manganese

5. What is the purpose of adding chlorine to domestic water supplies?

- (A) To reduce the pH of the water
- (B) To remove the heavy metal ions like lead from the water.
- (C) To clarify the water
- (D) To disinfect the water

6. In which layer of the atmosphere does ozone act as a UV radiation shield?

- (A) mesosphere
- (B) stratosphere
- (C) thermosphere
- (D) troposphere

# Section A

## Multiple Choice Answer Grid

1.	ΑΟ	BO	CO	DO
2.	ΑO	BO	CO	DO
3.	ΑO	BO	CO	DO
4.	ΑO	BO	СО	DO
5.	ΑO	BO	CO	DO
6.	ΑO	BO	СО	DO

## Section B: Short Answer Questions

### Question 7 (6 marks)

The Syntex Ammonia Corporation produces ammonia via the Haber process by mixing hydrogen and nitrogen in a 3:1 mole ratio and passing it over a promoted iron catalyst at 500°C and 200 atm. Under these conditions the yield of ammonia is 20%.

The graph shows a pair of lines for the reaction of hydrogen and nitrogen during the synthesis of ammonia...

**Reaction Co-ordinate** 

(a) Draw in a line showing the simultaneous production of ammonia during this process. (1 mark)

(b) Explain the effects of temperature on the production of ammonia. (4 marks)

(c)	In 1918 Fritz Haber was awarded the Nobel Prize for his ammonia process.
	Why was this discovery so significant to warrant a Nobel Prize?

(1 mark)

# Question 7 (4 marks)

Mount Ruse<sup>®</sup> Mineral Water is analysed for the presence of iron, chloride and carbonate ions.

(a) Complete the table showing suitable test reagents and results... (3 marks)

Ion tested	Test reagent used (name <u>or</u> formula)	Observed result for a positive test
iron		
chloride		
carbonate		

(b) Mount Ruse<sup>®</sup> Mineral Water is also known to contain calcium ions.
Describe a simple test to detect calcium which does not involve a test reagent. (1 mark)

# Question 8 (4 marks)

(a) Describe what is meant by a coordinate covalent bond.

.....

(b) Circle the covalent bond in the diagram of ozone.

(c)	Identify the type of diagram used in question (b) above.
(d)	The diagram used in question (b) above is one way to model a molecule of ozone. State one limitation of such a model

# Question 9 (6 marks)

Given below is a diagram which represents the design of a microscopic membrane filter.

Explain how the filter works and assess the effectiveness of this method of filtration in its use to purify water supply

### Part B: Atomic Absorption Spectrometry:

The chromium in an aqueous sample was determined by pipetting 10.0 mL of the sample into a 50.0-mL volumetric flask and diluting to volume. The solution was measured by atomic absorption along with four standard solutions of chromium. The results are given below:

Sample	Concentration, ppm	Absorbance
Standard A	2.4	0.091
Standard B	4.8	0.177
Standard C	7.2	0.266
Standard D	9.6	0.353
Unknown Cr	Unknown	0.201

(a) Plot the data

(b) Calculate the concentration in mol  $L^{-1}$  of Cr in the original sample. (3 marks)

.....

End of Test

### Section A: Multiple Choice (1 mark each)

Select the alternative A, B, C or D that best answers the question. Fill in the response oval completely.

Sample:	2 + 4 =	(A) 2	(B) 6	(C) 8	(D) 9
		$A \bigcirc$	В 🔴	СО	D ()

If you think you have made a mistake, put a cross through the incorrect answer and fill in the new answer.

If you change your mind and have crossed out what you consider to be the correct answer, then indicate the correct answer by writing the word **correct** and drawing an arrow as follows.

### Write your answer on the response grid on page 2

1. Which statement is correct concerning the use of a catalyst in the Haber Process?

- (A) The catalyst enables a lower reaction temperature to be used.
- (B) The catalyst produces ammonia of greater purity.
- (C) The catalyst speeds up the forward reaction and slows down the reverse reaction.
- (D) The catalyst removes ammonia from the product mixture allowing the equilibrium to shift to the right.

#### <u>Answer</u> – (A) <u>Outcome</u> – H8

2. What is the name of the compound below?

- (A) 1-chloro-1,2-difluoropropane
- (B) 3-chloro-2,3 difluoropropane
- (C) 1,2-difluoro-1-chloropropane
- (D) 1-chloro-1,2-fluoropropane

### Answer: A Outcome(s): H9

3. Which conditions would Le Chatelier advise for the maximum production of ammonia

- (A) low pressure and low temperature
- (B) low pressure and high temperature
- (C) high pressure and low temperature
- (D) high pressure and high temperature

<u>Answer</u> – (C) <u>Outcome</u> – H8 4. Sydney Water tests a sample of water at Warragamba Dam. The results are shown in the table...

Aluminium	Total chlorine	<i>Fluoride</i>	$Iron \ (\mu g L^{-1})$	Manganese
(µg L <sup>-1</sup> )	(mg L <sup>-1</sup> )	(mg L <sup>-1</sup> )		(µg L <sup>-1</sup> )
< 10	1.52	1.11	< 20	6

Which chemical species could be efficiently assayed using AAS?

- (A) Total chlorine
- (B) Total chlorine and fluoride
- (C) Aluminium, iron and manganese
- (D) Aluminium, total chlorine, fluoride, iron and manganese

#### <u>Answer</u> – (C) <u>Outcome</u> – H4

5. What is the purpose of adding chlorine to domestic water supplies?

- (A) To reduce the pH of the water
- (B) To remove the heavy metal ions like lead from the water.
- (C) To clarify the water
- (D) To disinfect the water

Answer:D Outcome(s): H4, H8

6. In which layer of the atmosphere does ozone act as a UV radiation shield?

- (A) mesosphere
- (B) stratosphere
- (C) thermosphere
- (D) troposphere

## Answer: B Outcome(s): H6

## Section B: Short Answer Questions

### Question 7 (6 marks)

The Syntex Ammonia Corporation produces ammonia via the Haber process by mixing hydrogen and nitrogen in a 3:1 mole ratio and passing it over a promoted iron catalyst at 500°C and 200 atm. Under these conditions the yield of ammonia is 20%.

The graph shows a pair of lines for the reaction of hydrogen and nitrogen during the synthesis of ammonia...

**Reaction Co-ordinate** 

- (a) Indicate on the graph the amount of ammonia during the same period by drawing in a line showing the simultaneous production of ammonia during the process (2 mark)
- (b) Explain the effects of temperature on the rate of production and yield of ammonia. (4 marks)

**Reaction Co-ordinate** 

<u>Answer</u> – Ammonia line must equilibrate at 0.4 mole to match hydrogen and nitrogen lines. (1 mark) <u>Outcome</u> – H10

(b) Explain the effects of temperature on the production of ammonia. (4 marks)

Outcome - H8

Temperature has a dual effect on the production of ammonia.

(1) An <u>increase</u> in temperature will <u>increase</u> the reaction <u>rate</u> (1 mark) because more molecules will have <u>more energy</u> to exceed the activation energy (1 mark).

(2) According to Le Châtelier's Principle, an <u>increase</u> in temperature will favour the <u>endothermic</u> reaction and shift the equilibrium to the <u>left</u> (1 mark), resulting to <u>reduced</u> ammonia production (1 mark).

(c) In 1918 Fritz Haber was awarded the Nobel Prize for the ammonia production process.
What was the greatest benefit of this process? (1 mark)

During the era of the Haber Process, scientists predicted the exhaustion of Chilean reserves of natural nitrate fertiliser would result in greatly lower agricultural production and possible famine. The Haber Process enabled the cheap production of ammonia which could be easily oxidised to produce synthetic nitrates.

#### Outcome - H4

# Question 8 (7 marks)

Mount Ruse<sup>®</sup> Mineral Water is analysed for the presence of iron, chloride and carbonate ions.

(a)	Complete the tab	le showing suitable	e test reagents and results	(6 marks)
()				(

Ion tested	Test reagent used (name <u>or</u> formula)	Observed result for a positive test
iron (III)		
chloride		
carbonate		

Ion tested	Test reagent used (name <u>or f</u> ormula)	Observed result for a positive test	
iron(II)	K3Fe(CN)6 (aq)	Blue colouration forms	
iron(II)	NaOH (aq)	Green precipitate forms	
iron(III)	K4Fe(CN)6 (aq)	Blue colouration forms	1 mark
iron(III)	KSCN or NH4SCN	Blood red colouration forms	
iron(III)	NaOH (aq)	Brown precipitate forms	
chloride	AgNO <sub>3 (aq)</sub>	White precipitate forms	1 mark
carbonate	HNO3 (aq)	Effervescence	1 mark

### <u>Outcome</u> – H8, 11

(b) Mount Ruse<sup>®</sup> Mineral Water is also known to contain calcium ions.
Describe a simple test to detect calcium which does not involve a test reagent. (1 mark)

### A positive flame test for calcium ions would be indicated by an orange/brick-red colouration.

## <u>Outcome</u> – H11

### Question 9 (4 marks)

(a) Describe what is meant by a coordinate covalent bond.

(b) Circle the covalent bond in the diagram of ozone.

(c) Identify the type of diagram used in question (b) above.

-----

(d) The diagram used in question (b) above is one way to model a molecule of ozone. State one limitation of such a model

.....

.....

### Outcome(s): H4, H6

Criteria	Marks
a) correctly defines coordinate covalent bond	1
b) correctly circles coordinate covalent bond	1
c) correctly identifies Lewis dot diagram	1
d) correctly states 1 limitation of modelling	1

#### Sample answers:

(a) A coordinate covalent bond is one in which both of the shared electrons come from the one atom

(c) Lewis dot diagrams

*(b)* 

(d) One limitation of this model is that it is only a representation of the molecule and is not indicative of its size or its 3D nature.

### Question 10 (5-marks)

The concentration of chromium in an aqueous sample was determined by pipetting 10.0 mL of the sample into a 50.0-mL volumetric flask and diluting to volume. The solution was measured by atomic absorption along with four standard solutions of chromium. The results are given in the table.

Sample	Concentration, ppm	Absorbance
Standard A	2.4	0.091
Standard B	4.8	0.177
Standard C	7.2	0.266
Standard D	9.6	0.353
Unknown Cr	Unknown	0.201

(a) Draw a graph of the data.

(2 marks)

CONCENTRATION (ppm)

.....

Marking:

1 mark for axis labels

1 mark for points correctly plotted

(b) Calculate the concentration in mol  $L^{-1}$  of Cr in the original sample. (3 marks)

# ANS

From the graph, the concentration in ppm of the unknown is 5.3 ppm (1 mark) The concentration of Cr in the original sample is 5.3 ppm x  $\frac{50}{10} = 26.5$  ppm (1 mark)

$$in \ mol \ L^{-1} \ Cr \ = \ \frac{26.5 \ mg \ / \ L}{(1000 \ mg \ / \ g) \ x 52.00 \ g \ / \ mole} = 5.1 \ x 10^{-4} \ mol \ L^{-1}$$

## Question 11 (6 marks)

Given below is a diagram which represents the design of a microscopic membrane filter.

Explain how the filter works and assess the effectiveness of this method of filtration in its use to purify water supply

Criteria	Marks
A judgement of effective usage, a description of usage, and a good description of	
function	5-6
Good explanation of function and a description of its usage	4
Good explanation of how the filter works	3
Adequate explanation of how the filter works	1-2

### Sample Answer:

A membrane filter is usually a thin film of a synthetic polymer through which there are pores of fairly uniform size. These pores can be very small, e.g.,  $0.2\mu$ m, and can filter out much smaller particles than sand filters

The dirty water flows into the filter (black arrow) and the membrane filters out the particles (black dots) and clean water moves through the membrane and flows out of the centre of the filter (clear arrow). The filter can be easily cleaned by back flushing

These filter are very effective in water purification systems. They can filter out most particles and even *giardia* and *cryptosporidium* that caused recent health scares in Sydney water supplies. They are easily cleaned and reasonably strong and can be arranged with a large surface area for extensive water treatment.
